My journey to software development began as a graphic designer for a skateboarding company. Learning the art of design eventually led me to starting my own brand and venturing into manufacturing clothing. While learning how to manage a business effectively, building a screenprinting facility, and going through college, I found my passion for building things. After an internship with a digital marketing agency, I gained a curiosity for development. That curiosity stuck, led me to a job fixing software issues for a living, and then to a software bootcamp where I could combine my new interest with my passion for building things.

Projects

dibs

dibs is a web application designed to help gyms create classes and provide an easy way for members to reserve a spot in those classes. This is a single page app built in ReactJS with data stored in a JSON file. Two user types are involved. Instructors have the ability to create, edit

and delete classes. Users have the ability to reserve spots, drop spots and add the class to their preferred calendar application (ex. Google Calendar, Outlook, Apple Calendar).
